

Prompt to LLM :

For summarization of participants interpretations :

You are given a list of sentences that represent different users' interpretations of a certain property. Your task is to analyze these interpretations and generate top 5 representations

For recommendation of DDPs :

I am an engineer in a short form video streaming platform operating in the European union. The European Union requires us to comply with the General Data Protection Regulation (GDPR). As per Article 15 of GDPR, we have to give end users a copy of their data that we are processing. This data, as per GDPR, should follow the following properties :

- (1) Conciseness*
- (2) Clear and Plain Language*
- (3) Transparency*
- (4) Intelligibility*

I have done a user survey and the expectation and interpretation of the users for each of the following property are:

(1) Conciseness :

- 1. Personal data shared concisely should present only the essential information in a direct and summarized manner, avoiding unnecessary details or lengthy explanations, so that users can quickly grasp the key points.*
- 2. The data should be provided in a clear, to-the-point format, such as a list, table, or bullet-points, avoiding verbose language and irrelevant details, allowing users to easily access the important data.*
- 3. Concise data means providing only what is necessary for the user to understand the data being processed, and its purpose, without overwhelming them with extraneous details, allowing them to clearly and quickly understand what is being shared.*
- 4. Users expect a summary of their data, avoiding data dumps and focusing on essential and relevant information, so that it is manageable and does not require excessive effort to interpret.*
- 5. Conciseness does not mean omitting important details, but rather presenting all the essential information in a way that is direct, accurate, and respectful of the user's time.*

(2) Clear and Plain Language :

- 1. Personal data shared in clear and plain language should be free of jargon, technical terms, or ambiguity, making it straightforward to understand and interpret.*
- 2. The information should be presented in a direct, concise manner, free from jargon, acronyms, and overly complex sentence structures, so that it is easily interpreted by a general audience.*
- 3. Data should be communicated using common terms and in a way that can be easily understood by anyone, including children or those with limited knowledge of legal or technical terms.*

4. *The shared personal data should be presented in a way that avoids technical or legal jargon, using simple and understandable terms, and available in multiple languages, including the user's native language, to ensure clarity and accessibility.*
5. *The language used should be natural and straightforward, like a conversation, rather than a legal document, avoiding ambiguous or misleading information, and providing a clear picture of what the data represents and how it is being used.*

(3) Intelligible

1. *Personal data shared must be clear, easy to understand, and presented in a way that the average person can readily interpret, regardless of their technical expertise or background.*
2. *The information should be presented in simple language, avoiding jargon, technical terms, legal language, or complex structures, so that it is easily comprehensible to all users.*
3. *Data communications should use common language and relatable examples, ensuring that it is easily understandable for everyone without needing additional explanations or knowledge.*
4. *The goal is to ensure users can make informed decisions about their data based on clear, accessible, and readily interpretable information, not complicated by technicalities.*
5. *Intelligible data means that it is not encoded or obscured, but is presented in a way that allows any user to quickly and accurately grasp its meaning and implications.*

(4) Transparent

1. *Transparency in personal data sharing means providing a clear, honest, and complete account of how the data is collected, used, stored, and shared. The user should be able to easily understand the purpose of processing, the parties involved, and any associated risks.*
2. *I do expect it to be transparent and show all relevant information in regards to my personal information without any hurdles.*
3. *What data is being collected, how and why it is processed, who has access to it, and for how long it is retained, with honesty*
4. *Individuals should clearly understand what data is collected, why it is collected, how it will be used, and who it may be shared with, through accessible and easy-to-understand privacy notices or policies.*
5. *I expect every part of my data to be given to me, not only some elements*

Suppose a user requested the personal data for these categories - Watch History, Search History, Likes, Comments, Saved, Login History, Connections, Personal Information, Autofill Information, Location, Devices, Content created by users, and Off-Platform Activities. What data fields should I provide?

LLM Output for recommendation:

Okay, here's the same data structure represented in JSON format. This format is easily machine-readable and can be used to generate human-friendly presentations. I've added some example data to show how it might look in practice:

```
{
  "userData": {
    "watchHistory": [
      {
        "videoTitle": "Funny Cat Compilation",
        "videoId": "12345",

```

Key Points:

- **Structure:** The data is organized hierarchically under a main `userData` object, with each category as a key containing an array of objects.
- **Data Types:** I've used strings, numbers, and arrays to represent the different types of data.
- **Completeness:** The JSON representation is complete for all the categories mentioned in the prompt.
- **Readability:** While JSON is machine-readable, I've strived to make it clear and understandable, mirroring the clarity you want for the users.
- **Flexibility:** The JSON can easily be parsed and used to display user data in any desired format, making it an ideal solution for a user-facing GDPR data request.

This JSON structure provides a comprehensive, organized, and machine-readable way to deliver a user's personal data in accordance with GDPR's requirements. Let me know if you would like to modify it further.
